

Exhaust Filter Bypass Kit

Thank you for purchasing the KP Exhaust Filter Bypass Kit. This kit is designed for the everyday rider and racer. This filter bypass is designed to reduce exhaust restrictions and temperature. Please keep in mind, removing the element will allow more moisture to travel up the exhaust. To prevent valves from rusting, it is crucial to blow out the moisture after flushing the machine. In fresh water, if you do not flush, you will still need to blow out the moisture.

Moisture removal Procedure:

After flushing let machine sit a minute and remove hose. Fire up machine without water and turn it off after 2 seconds. Repeat this process 5-10 times as necessary until little water comes out the exhaust.

Torque the four mount bolts to 33 ft.lb
